

**skippodisk** is a free AUv3 plugin and standalone app. It features algorithm that imitates compact disc reading errors and adds feedback for some comb filtering.

### controls

- main control is a **2-dimensional slider** that changes delay time / buffer size using value on X axis and feedback (positive and negative, -0.997 to 0.997) on Y axis. This control adds some creative comb-like effect.
- algorithm settings:
  - [ auto ]** enables automatic cd skipping.
  - [ dropout ]** enables adding silence. Use both [auto] and [dropout] with zero feedback value (in the centre of touch control) to achieve the effect of a CD audio glitch
- **[ bypass ]** control and volume control. This slider is in low value state by default.
